## **Project Narrative Description**

Charge Spot is intended to demonstrate the feasibility of an autonomous electric vehicle charging system for residential use. The goal of Charge Spot is to have no user interaction and no physical connection between the car and the charging station.

Remembering to charge your electric vehicle every day is hard enough as it is. And if you forgot to charge it overnight you may not make it to work the next day. Also the task of undoing cables and precisely aiming and connecting charge connectors can be a bit of a hassle sometimes. Charge Spot is designed to eliminate these concerns and also include added features necessary for peace of mind. This is a hands-free, intelligent charging system, capable of fully charging your electric vehicle without human intervention. All you do is park your car as you would normally and the rest is taken care of.

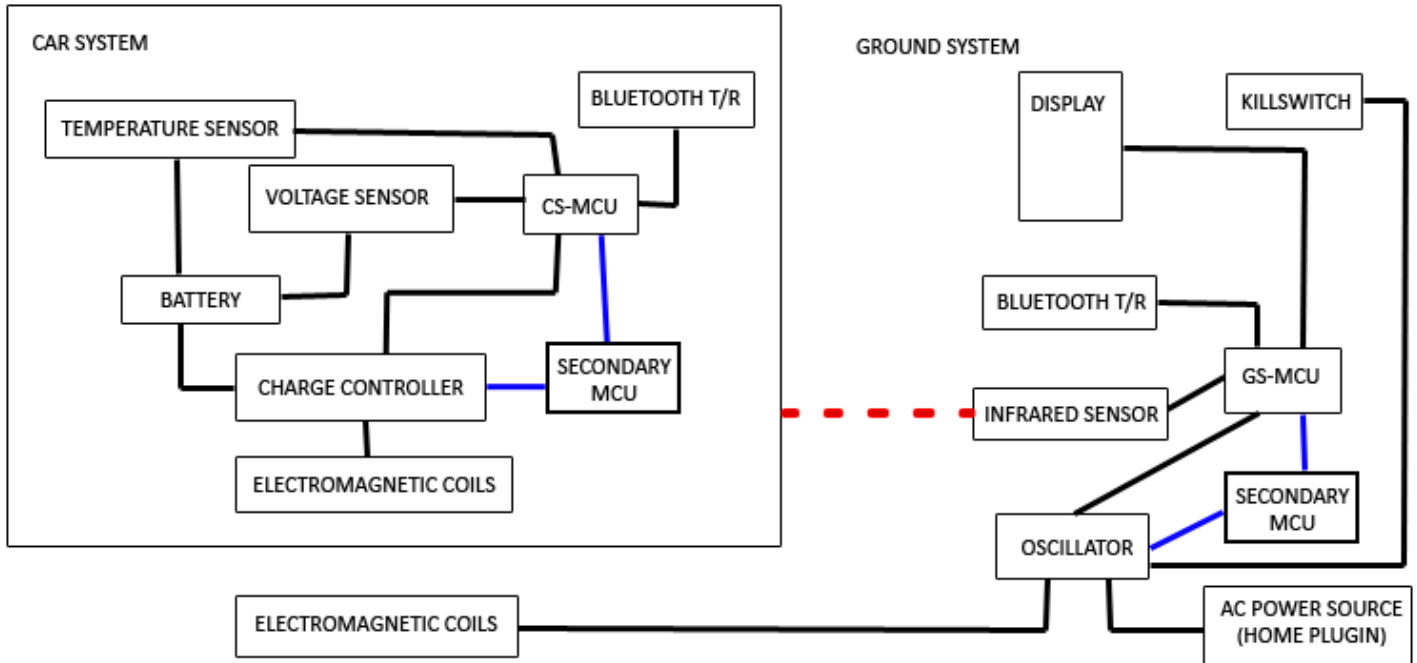

A proximity sensor detects the presence of a vehicle and immediately activates Bluetooth connectivity between the car and the charge panel. While Bluetooth pairing is underway, the car is being guided into place by the proximity sensor with a visual aid indicating proper alignment of both the car coil and the ground coil. Upon successful pairing, the battery status and temperature information is sent from the car to the panel via Bluetooth. After preset parameters for battery temperature is met, and battery status is determined to be less than 100%, the charging system is activated and the car battery will be charged with the high resonance frequency charging system.

Battery status is monitored and displayed on the panel along with battery temperature. When fully charged the charging system is designed to shut down automatically.

## **List of Specifications**

1. Proximity sensor capable of detecting car within 5 feet of panel
2. Coil attached to car small and lightweight (approx. 2lbs)
3. A fail safe, shut down switch
4. Maximize charge time by adjusting charge current based on battery level
5. Battery status displayed on panel using 11-segment and LED bar displays
6. Proximity status for alignment displayed on panel
7. Battery temperature displayed on panel
8. No physical cable connectivity between car and charge system
9. Automatic shutdown when fully charged
10. Car should begin charging within 10 seconds of successful alignment
11. Eliminates trip hazard

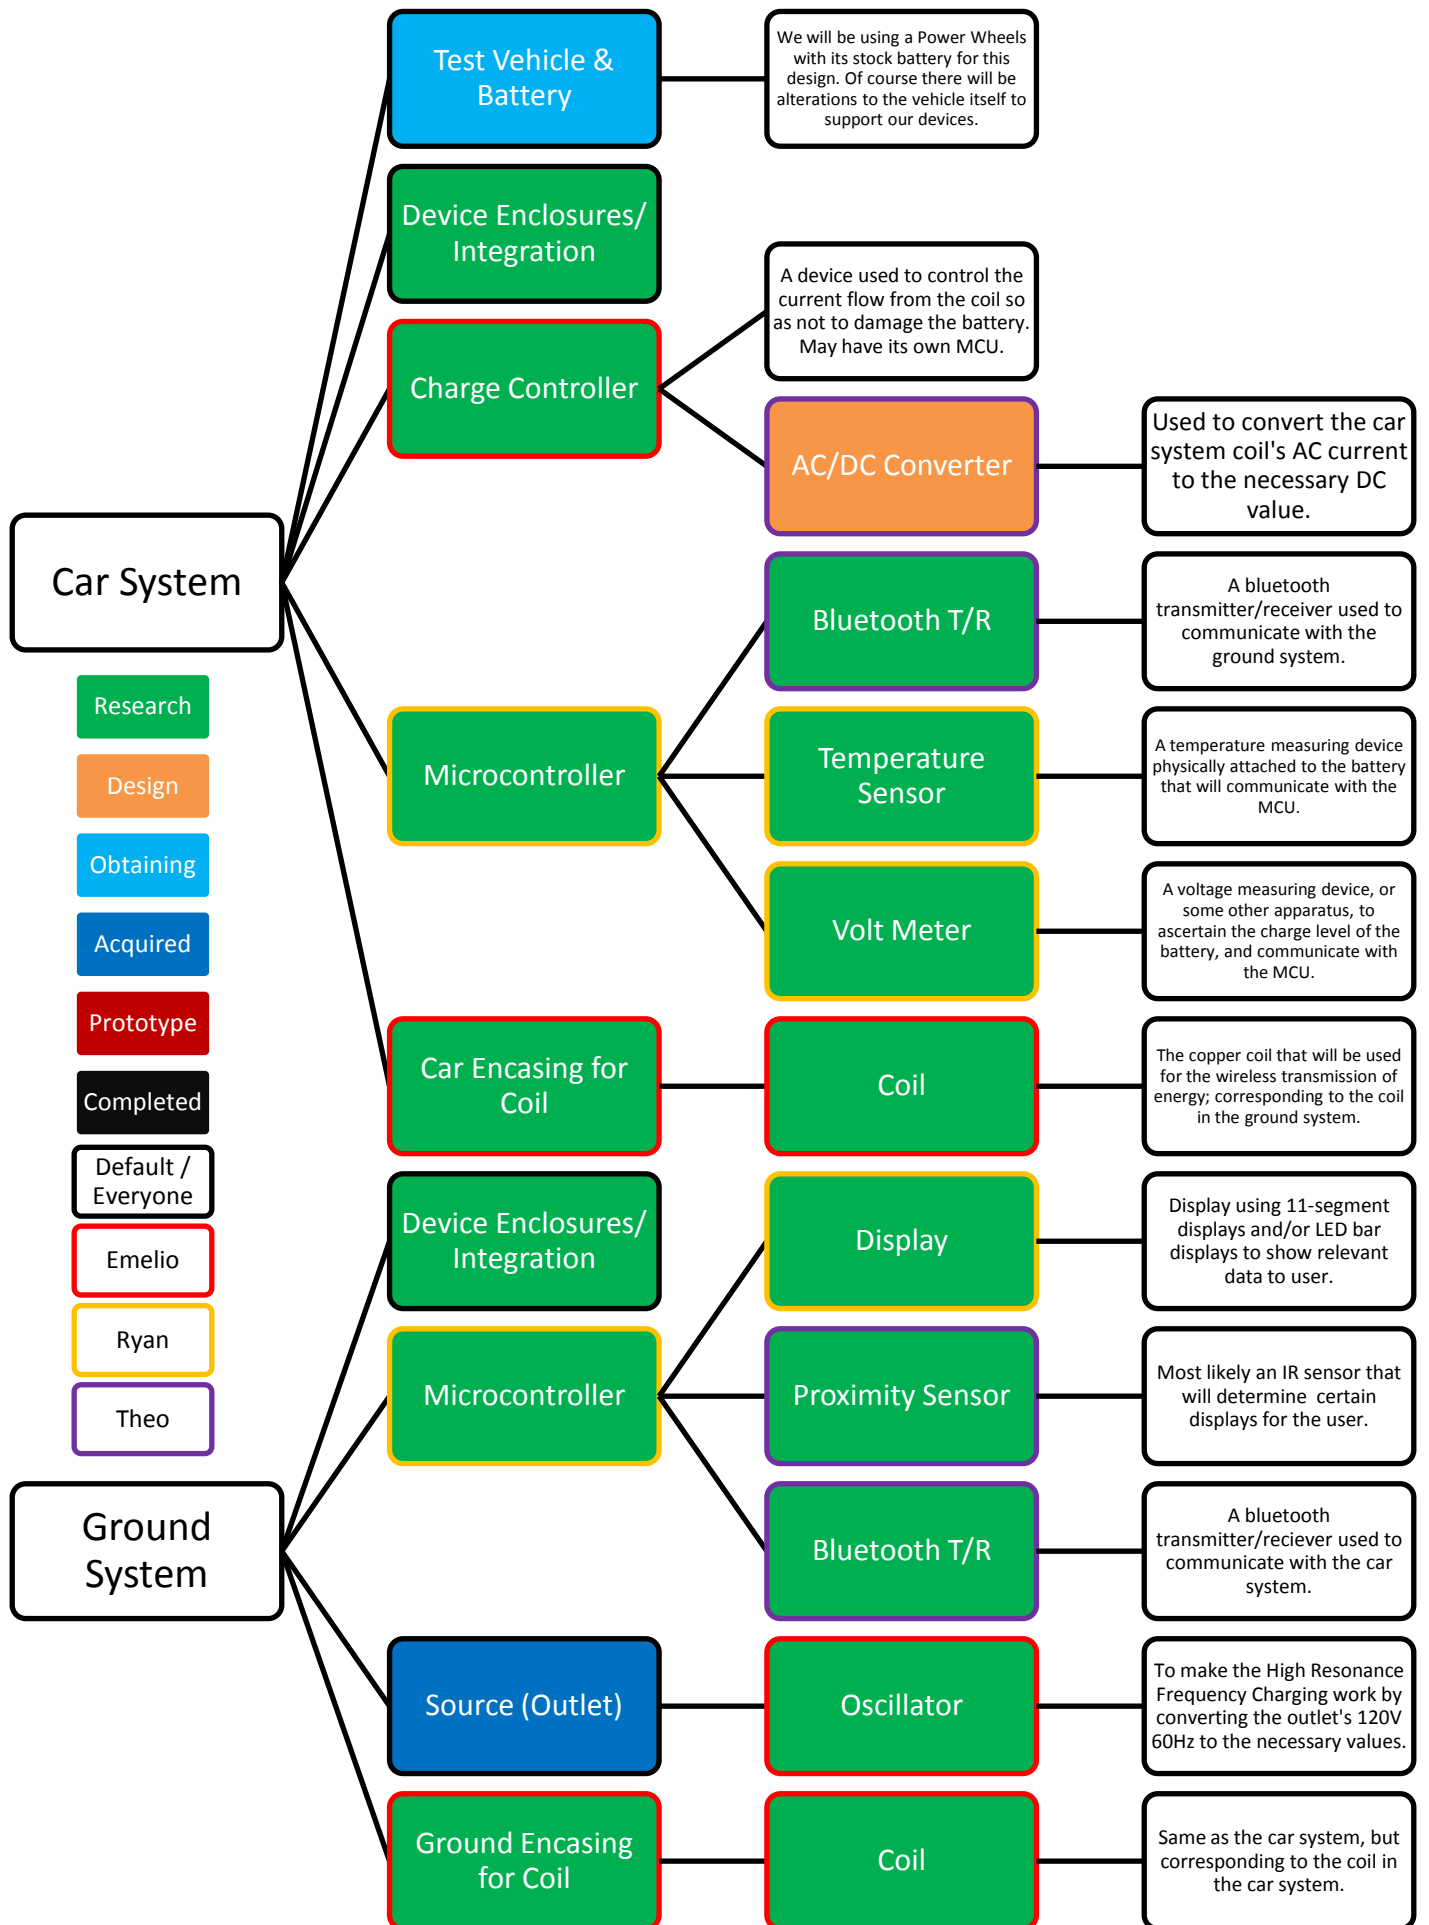

## Block Diagram – Physical Connections

This is a very rough display of the prototype of our project. Each piece is explained in further detail below; this diagram just shows the physical connections of each component in the systems. If we opt for the two optional MCUs, instead of using one in each system, the blue line will represent the new connections, and the previously used black lines will become obsolete. Not shown is exactly how each component will be setup, or physically mounted. The entire ground system, except the electromagnetic coils and the power source, will be housed in a metal box, with a cutout for the LED display. The car system will be mounted for concealment. The two coils will be housed in a special encasing which we are still researching.

## Block Diagram – Component Details

On the next page is the detail block diagram.

## Budget

The generous budget to the copper coil and wiring is due to the necessity of the amount we need. The coil itself will either be molded by us or bought that way, depending on cost and availability. The wires will also be a special wire used solely by the coils; this does not include the wiring for other devices. The vehicle we will be using will be a PowerWheels with its stock battery. We will be obtaining a used, working one preferably for a sound amount of money, which will be a challenge considering recent Craigslist postings.

The sensors, display, MCUs, and Bluetooth chips are given a bloated budget, just in case they don't work and we need to acquire another, or a different type. The sensor has a considerably larger budget because we're not sure of the type of proximity sensor to use – we can use either the more accurate and more expensive laser sensor, or the cheaper infrared sensor. As for the display, this includes all the LED Bar displays and the 11-segment displays. However, since we cannot find suitable LED bar displays, we may make our own.

The encasings/integration involves the encasing of the two coils and the encasing of the display. This slice basically involves the cost of putting everything together, soldering and wiring cost, the cost of physical parts used for encasing (wood frame, metal box), and possibly the cost of labor required, if applicable.

## Project Milestones

<b>Task Name</b>	<b>Duration</b>	<b>Start</b>	<b>Finish</b>
<b>1) Definition</b>	<b>2 weeks</b>	<b>Tue Sept 3<sup>rd</sup> 2013</b>	<b>Mon Sept 9<sup>th</sup> 2013</b>
➤ Define project	2 weeks	Tue Sept 3 <sup>rd</sup> 2013	Mon Sept 9 <sup>th</sup> 2013
<b>2) Research</b>	<b>8 weeks</b>	<b>Mon Sept 16<sup>th</sup> 2013</b>	<b>Sun Nov 10<sup>th</sup> 2013</b>
➤ Type of Vehicle	2 weeks	Mon Sept 16 <sup>th</sup> 2013	Sun Sept 29 <sup>th</sup> 2013
➤ Blue Tooth T/R	3 weeks	Mon Sept 16 <sup>th</sup> 2013	Sun Oct 6 <sup>th</sup> 2013
➤ Temperature Sensor	3 weeks	Mon Sept 16 <sup>th</sup> 2013	Sun Oct 6 <sup>th</sup> 2013
➤ Charge Controller	2 weeks	Mon Oct 7 <sup>th</sup> 2013	Sun Oct 20 <sup>th</sup> 2013
➤ Volt Meter	3 weeks	Mon Oct 7 <sup>th</sup> 2013	Sun Oct 28 <sup>th</sup> 2013
➤ Type of Coil	3 weeks	Mon Oct 13 <sup>th</sup> 2013	Sun Oct 3 <sup>rd</sup> 2013
➤ Display	3 weeks	Mon Oct 13 <sup>th</sup> 2013	Sun Oct 3 <sup>rd</sup> 2013
➤ Proximity Sensor	3 weeks	Mon Oct 13 <sup>th</sup> 2013	Sun Oct 3 <sup>rd</sup> 2013
➤ MCU	3 weeks	Mon Oct 21 <sup>st</sup> 2013	Sun Nov 10 <sup>th</sup> 2013
<b>3) Design</b>	<b>6 weeks</b>	<b>Mon Nov 11<sup>th</sup> 2013</b>	<b>Sun Dec 22<sup>nd</sup> 2013</b>
➤ Hardware	6 weeks	Mon Nov 11 <sup>th</sup> 2013	Sun Dec 22 <sup>nd</sup> 2013
• Oscillator	6 weeks	Mon Nov 11 <sup>th</sup> 2013	Sun Dec 22 <sup>nd</sup> 2013
• Blue tooth	6 weeks	Mon Nov 11 <sup>th</sup> 2013	Sun Dec 22 <sup>nd</sup> 2013
• Charge Controller	6 weeks	Mon Nov 11 <sup>th</sup> 2013	Sun Dec 22 <sup>nd</sup> 2013
➤ Software	6 weeks	Mon Nov 11 <sup>th</sup> 2013	Sun Dec 22 <sup>nd</sup> 2013
