# Motivation and Background

- Ease of Use for Non-Gardening Experts
  - Many people are discouraged from plant care due to a lack of knowledge or confidence. This system lowers the barrier to entry by automating key tasks, making gardening approachable for beginners.
- Benefits of Automating a Home Growing System
  - Automation reduces the time and effort needed to maintain healthy plants, allowing users to enjoy the therapeutic and aesthetic benefits of greenery without daily oversight.
- Resource Management/Efficiency
  - By monitoring light and moisture conditions, the system optimizes water and energy usage, reducing waste and increasing sustainability.
- Indoor Accessibility
  - The smart garden system enables successful plant growth indoors, even in environments with limited natural light or irregular maintenance schedules.

# Goals and Objectives

## Goal 1: Create an Optimized Indoor Growing Environment

- Automatically deliver species-specific water amounts using a pump and solenoid valve system.
- Provide optimal spectral light output for plant growth, including the use of programmable LEDs.
- Use sensor data from light sensors and moisture sensors to create a feedback loop that controls each environment individually
- Simulate natural light cycles through duty cycling and on/off scheduling.
- Measure real-time temperature and humidity for updating the user via the app.
- Transmit multiplexed sensor data to the MCU
- **Stretch Goal:** Use ultra-low-power sensors that require infrequent battery replacement; only twice a year under constant use.
- **Stretch Goal:** Implement individual ESP32 modules on the soil moisture sensor for wireless communication to the main PCB, using the ESP-NOW protocol for communication

## Goal 2: Develop a User Friendly Mobile Application

- Allow users to manually input target values for soil moisture and lighting.
- Display real-time sensor data, including moisture and temperature readings.
- Provide preset growth profiles for Florida plants commonly grown indoors.
- Notify the user when sensor values exceed or fall below critical thresholds.
- **Stretch Goal:** Adapt watering schedules based on plant growth stage (e.g., seedling, budding, flowering).

# Engineering

| Specifications Table                             |                                    |
|--------------------------------------------------|------------------------------------|
| Parameter                                        | Requirement                        |
| App Data Refresh Rate                            | At least once every hour           |
| Soil Temperature Polling Rate                    | At least once every hour           |
| Soil Moisture Polling Rate                       | At least once per minute           |
| Number of Environments Maintained Simultaneously | At least 3                         |
| Power Consumption (120V LED lights)              | Less than 200 Watts                |
| Electronic Solenoid Valve Response Time          | Less than 5 seconds                |
| Water Pump Rate                                  | At least 1 GPM (Gallon per Minute) |
| Water Pump Pressure                              | At least 40 PSI                    |
| Water Pump Power Consumption                     | Less than 75 watts                 |
| Maximum Shelf Size                               | 4'x 6'x3'                          |
| 15A Breaker Trip Time (12V)                      | Less than 100 milliseconds         |
| 15A Breaker Trip Time (120V)                     | Less than 100 milliseconds         |

- From a design perspective, it is important that the feedback sub-systems that ultimately control the environments frequently update
- From the perspective of the user, the most relevant specifications include the number of environments that are maintained simultaneously, as well as safety features like the breaker trip time

# How F.L.O.W.E.R.S. Operates: The Physical Unit

The physical unit can simultaneously maintain 3 individual environments, meeting each environment's own needs for watering and lighting

# How F.L.O.W.E.R.S. Operates: The Physical Unit

x3

3 capacitive soil moisture sensors will be used, one for each environment

The user will be in charge of placing the sensor into each plant pot and switching the sensor into the new plant pot upon swapping the plant in the environment, as well as entering the environmental needs for the plant (light, water, etc.) in the app

# How F.L.O.W.E.R.S. Operates: The Physical Unit

The main PCB will be attached to the back of the environments, connected to each soil moisture sensor with wires

A 3D-printed decorative cover will be attached to protect the PCB and act as branding for F.L.O.W.E.R.S.

# How F.L.O.W.E.R.S. Operates: Incorporating the Software

1

The user places the plant into the environment, and inserts the soil moisture sensor

2

The user enters the environmental needs including soil moisture

3

The info is sent to the main PCB and the ESP32 will handle polling the soil moisture sensors and sending the water, if needed

# Technology Selection: Main PCB

# Hardware Selection: Water Pump

## Water Pump Selection Summary:

- Selected Pump: Model R3526144D
- Supply Voltage: 12V DC — consistent with overall system requirements
- Flow Rate: Delivers 3.0 GPM — Beyond Sufficient for needs
- Pump type- Demand Pump
- Maintained Pressure: 50 PSI — sufficient for our vertical planter system
- Cost: \$49.99 — lowest-cost option
- Trade-offs Considered: Slightly lower pressure compared to others, but acceptable within design limits. In fact, a flow regulator will still be used
- Rationale: Chosen for its optimal balance of performance, simplicity, and budget compatibility

| Model Number   | R3526144D | Delavan Powerflo 7822FS | Everflo EF2200 |
|----------------|-----------|-------------------------|----------------|
| Cost           | \$49.99   | \$81.37                 | \$77.47        |
| GPM            | 3.0       | 2.2                     | 2.3            |
| Sustained PSI  | 50        | 60                      | 70             |
| Supply Voltage | 12V       | 12V                     | 12V            |

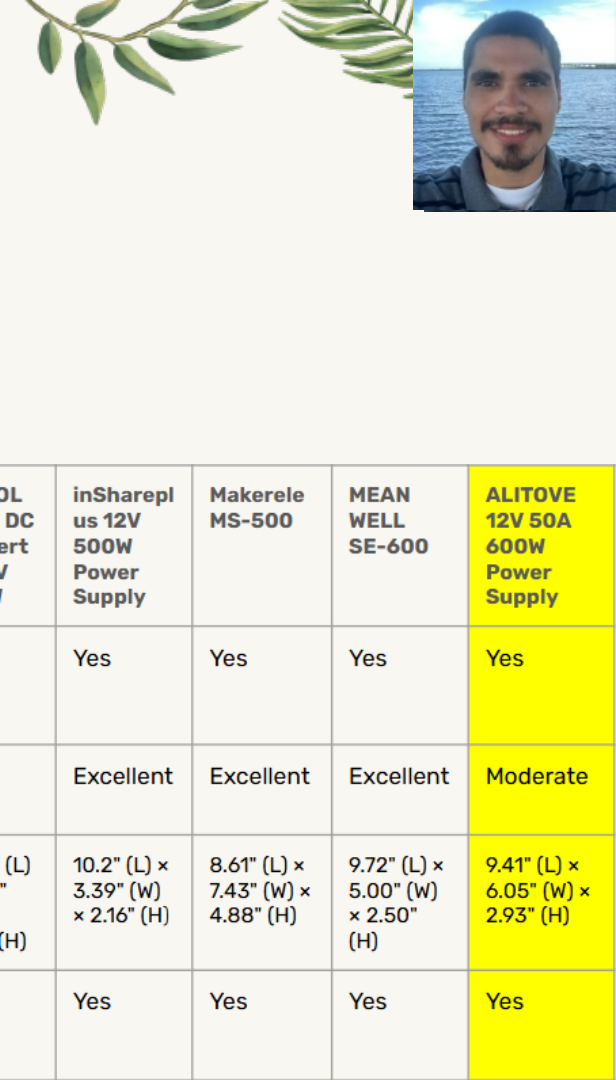

# LED Driver/ Wireless Relay

- For this project, we have chosen to control both the lights and solenoid valves wirelessly.
- For the solenoid valves, this was done for positioning, as it allows the main PCB to be physically disconnected from the valves, allowing easier placement of both.
- For the lights, not only was positioning important, but our design fundamentally requires the ability to dim the lights to supply optimal light intensity to the plants. Furthermore, the power requirements of the lights gave strong incentive to use wall power (120VAC) to power them.
- Therefore we needed a device that was controllable from the ESP32 wirelessly (via MTTQ), could handle the power rating of three simultaneous LED lights, and could function as both a relay (on/off) for the valves and an LED dimmer (via PWM) for the lights. Furthermore, since both the valves and the LED's were 12V devices, the output of our device needed to be 12V. The Shelly RGBW2 was the only device found that had all of these traits for a reasonable price.

# Hardware

## Selection: AC to DC Converter

- We have 4 unique devices that require 12V power, being the solenoid valves, the Shelly RGBW2, the LED lights and the water pump.
- Due to battery size limitations, we found it most practical to use wall power to power these devices
- Therefore, an AC to DC converter would be needed to both bring down the 120V wall power to 12V, and also rectify it to DC

| Specific AC to DC converter | XINCOL AC to DC Converter 12V 500W | inShareplus 12V 500W Power Supply | Makelele MS-500                   | MEAN WELL SE-600                  | ALITOVE 12V 50A 600W Power Supply |
|-----------------------------|------------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|

# Embedded Software Flowchart

This is the logic which drives the main ESP32

# Mobile App Software Flowchart

# Mobile App Use-Case Diagram

# ESP32 Communication -

## Initial Wi-Fi Connection and Setting Up Two-Way Communication for the MCU and app

### Mobile App

- When first powered on, the ESP32 on the main PCB is placed into Access Point mode
- The app will prompt the user to “Setup Smart Garden”
- User will enter the SSID (Wi-Fi network name) and input the password
- The app automatically connects to ESP32’s temporary access point, identified by an individual, automatically assigned identifier (ex. SmarGarESP-0001)
- The app will send an HTTP POST request including the credentials of the Wi-Fi network
- The ESP32 will save the SSID and password before switching to STA (station mode – no more access point mode), and connecting to the user’s Wi-Fi network
- The two-way communication connection will be considered successfully established and communicate real time updates via MQTT

# ESP32 Communication - MCU

- I2C is used to relay communication from Temp/Humidity sensors and Light sensors to I2C bus to ESP32.
- The capacitive moisture sensor will be wired directly to the ESP32 GPIO pins, and the raw voltage values will be converted to digital readings by the on-chip ADC.
- User will host a Wi-Fi connection which the ESP32 will connect to allowing for real-time monitoring of the condition of each plant (see previous slide).
- The ESP32 will control both the water pump and the LED light strips using the Shelly RGBW2. Communication between the ESP32 and the Shelly will be facilitated by using the ESP32 as an MQTT broker, and sending MQTT commands to the Shelly

# ESP32

The diagram shows an ESP32-WROOM-32 module with the following connections:

- USB-to-UART Bridge:** A USB-to-UART bridge chip is connected to the ESP32's UART pins. The bridge's VCC is connected to the 3.3V supply, and its GND is connected to the module's GND. The bridge's TX and RX pins are connected to the ESP32's TX (pin 1) and RX (pin 2) pins, respectively.
- 3.3V Regulator:** A 3.3V voltage regulator is connected to the module's GND and VCC pins. The regulator's input is connected to the 3.3V supply, and its output is connected to the module's GND.
- ESP32 Pin Connections:** The ESP32's TX (pin 1) and RX (pin 2) pins are connected to the bridge's TX and RX pins, respectively. The module's GND and VCC pins are connected to the 3.3V supply and GND.

### 3.3V Jumper Connections

# Main Board Layout

# 3.3V Regulator Layout

- One 3.3V regulator will be used to power the ESP32 on the main board.
- Three 3.3V regulators will be wired directly to the soil moisture sensors.
- A total of four regulators will be built that will each be supplied a  $V_{in}$  of 7.4V from the two lithium ion batteries on the main board.

# Mobile Walk-Through

Home Page (on App open)

User Taps "Add Plant" Quick Key, Fills out Info, and "Add Plant"

The Plant is Added to the "Environment" page in the designated environment.

The User selects the environment they want to view and the information for the selected environment loads onto the page

# Testing – Soil Moisture Values

In order to determine the threshold for the soil moistness, we tested the soil moisture in a fully submerged cup of water as well as exposed to only air to determine the numeric range which the ESP32 would need to use to determine “wet” soil versus “dry” soil.

Since the testing this far only involved pure water and air, the range in soil would be expected to be an even smaller set of values.

```
Moisture value: 930
Moisture value: 933
Moisture value: 933
Moisture value: 931
Moisture value: 933
Moisture value: 976
Moisture value: 931
Moisture value: 938
Moisture value: 939
Moisture value: 935
Moisture value: 930
Moisture value: 931
Moisture value: 933
Moisture value: 926
Moisture value: 919
Moisture value: 930
Moisture value: 928
Moisture value: 931
Moisture value: 928
Moisture value: 930
Moisture value: 937
Moisture value: 1058
Moisture value: 2035
Moisture value: 2511
Moisture value: 2526
Moisture value: 2524
Moisture value: 2510
Moisture value: 2494
Moisture value: 2509
Moisture value: 2519
Moisture value: 2490
Moisture value: 2522
Moisture value: 2514
Moisture value: 2513
Moisture value: 2512
Moisture value: 2519
```

900s-early 1000s range will indicate fully submerged in water

From here, we expect the range of soil to be from the 1000s to the 2000s where:

- 1000 - fully saturated soil
- 1250 - moderately saturated soil
- 1500 - average watered soil
- 1750 - fairly dry soil
- 2200 - completely dry soil

2000s+ range will indicate the soil moisture is exposed to air

# Completed Hardware Components

- Main PCB Board
- 3.3V Regulator
- Moisture Sensor Board
- Light Sensor Board
- Temp/Humidity Sensor Board
- Shelly RGBW2 acquired
- Water Pump acquired and tested
- Solenoid Valves acquired and tested
- AC to DC converter acquired

# Completed Software

# Progress Check - Software

- ✓ Mobile App - "Home" tab
- ✓ Mobile App - "Plants" tab Outline and basic implementation
- ✓ Mobile App - "Stats" tab
- ✓ Mobile App - "Settings" tab
- ✓ ESP32 - Soil Moisture, Lighting Sensor, Humidity/Temp Sensor implementation
- ✓ Deploy the app to mobile environment
- ✓ Complete the MQTT / ESP32 initialization and two way communication connection
- ✓ Mobile App - "Your Environment" tab
- ✓ Final data storage implementation (plant library)

# Progress - Hardware

- ✓ All PCBs have been acquired, and all components have been soldered on the respective boards
- ✓ Regulators have been tested
- ✓ Water Pump, AC to DC converter, and all solenoid valves have been acquired and tested
- ✓ Wire, configure, and test the temp/humidity and light sensors
- ✓ Wire the Solenoid Valves and the LED lights to the Shelly RGBW2, and confirm successful operation (see software progress for MQTT configuration)
- ✓ Calibrate Moisture sensor values using actual soil and associate these values with a given water pump flow rate

# Progress, Cont.

## Progress Report

The progress breakdown by category and how much of the project completion remains. Considering the completion of each category, the total amount of project completion needed to meet all of our goals and objectives is about 20%.

# Thanks !

Thank you for your time and for listening to how  
our project has **grown**.
